

Introduction

Namespace RonCS

Classes

[Ron](#)

Ron Serialization/Deserialization API.

[RonExcludeAttribute](#)

Field should not be serialized in a ron document.

[RonFromAttribute](#)

Marks a method as a candidate for RonFrom conversion when Serializing or Deserializing.

[RonIncludeAttribute](#)

Element should always be serialized, regardless of visibility.

[RonIntoAttribute](#)

Indicates that method can be used for ron auto conversion.

[RonListAttribute](#)

Marks a class or field as a list.

[RonMapAttribute](#)

Marks a class or field as a ron map.

[RonPrintOptions](#)

Ron print options.

[RonProxyAttribute](#)

Indicates that a class should be converted to or from the proxy type for serialization.

[RonTupleAttribute](#)

Marks a method that should be used to serialize the element as a ron tuple.

[SerializationContext](#)

Context for serializing ron elements. Custom overrides for Ron are stored in the local or global serialization context.

[TypeConversionExtensions](#)

Extension methods for converting ron objects.

Interfaces

[TypeSerializerConverter](#)

Base interface for serialization converters. Serialization converters convert C# objects into Ron AST nodes.

Enums

[RonPrintMode](#)

The print mode to use for Ron printing.
